LAYERS IN GIS

Layers are the mechanism used to display geographic datasets in ArcMap, ArcGlobe, and ArcScene Each layer references a dataset and specifies how that dataset is portrayed using symbols and text labels. When you add a layer to a map, you specify its dataset and set its map symbols and labeling properties. In Q-GIS layer are mainly three type, that's called Shape file layer. That is POINT, LINE and POLYGON

Point features are used to a specific location like lat long. Settlement. Line is used for linear features like road, railway, pipe line and the Polygon also for areal features like area. Periphery etc.

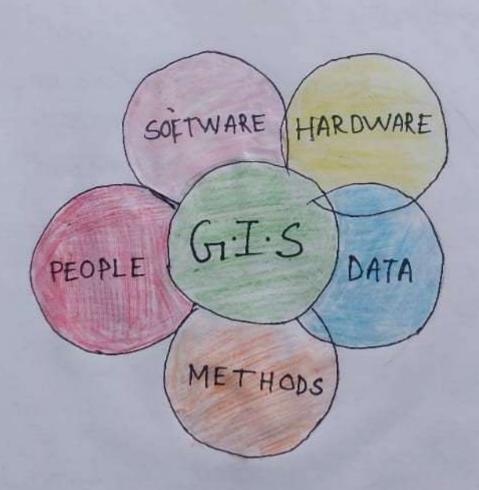

MAP LAYOUT

Map Layout is the assembling of the various elements of a map into a single whole, including the map itself, its legend, title, scale bars, and other elements. Map symbolism can rarely stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary information that a map is trying to tell, stand alone to sufficiently depict all the necessary inf

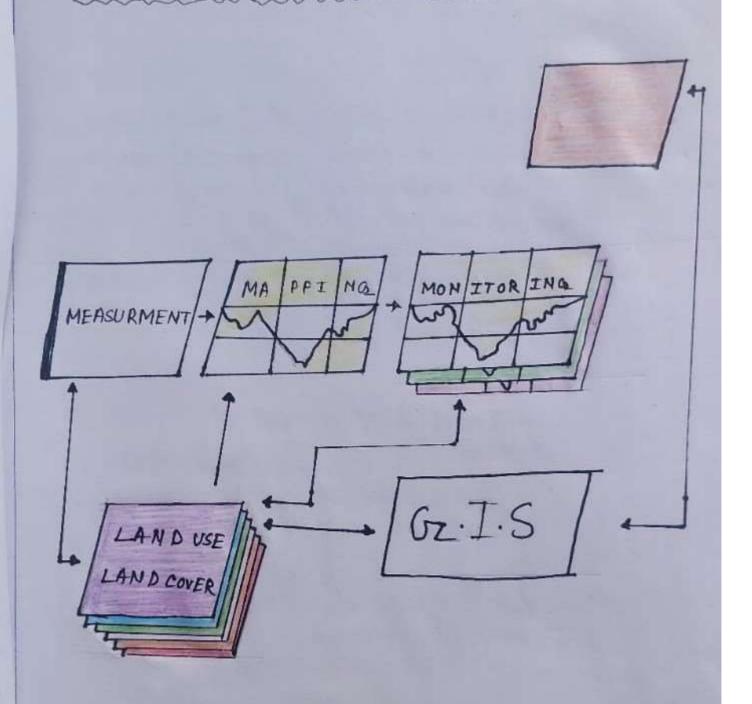

Components of Gis

geographic information System is a computer System Iculid to capture Stone. manepulate and tiyes, Manage and display all kind of spectful or geographical data. the give main components GITS is —

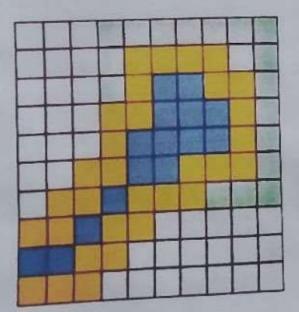

GLEOGERAPHIC INFORMATION SYSTEM

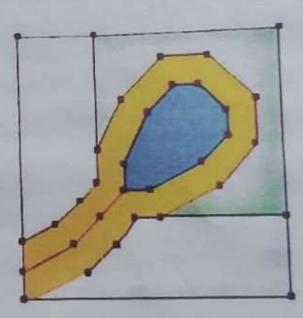

DIFFERENCE BETWEEN RASTER DATA AND VECTOR DATA MODEL

Rester Graphics Vector Graphics They are composed of pixels They are composed of paths In Raster Graphics, refresh process is independent Vector displays flicker when the number of of the complexity of the image primitives in the image become too large Graphic primitives are specified in terms of end points and must be scan converted into Scan conversion is not required corresponding pixels. Raster graphics can draw mathematical curves Vector graphics draw continuous and smooth lines polygons and boundaries of curved primitives only by pixel approximation Vector graphics cost more as compared to raster Raster graphics cost less graphics They occupy more space which depends on image They occupy less space quality File Extensions SVG EPS PDF AI, DXF File extensions BMP TIF GIF JPG

Raster

Vector
